Sedation with Benzodiazepines in MICU

Analysis for Alcalde

Elizabeth Franco, Jen Cortes

March 16, 2016

Continuous Data

Shapiro-Wilk normality test is performed and if the data is not normally distributed (the p-value is < 0.05), then the Mann-Whitney test is used to compare the medians of the groups.

If the data is normally distributed, an F-test is performed to determine if the groups have equal variances (p-value is ≥ 0.05) and then the appropriate t-test (with or without equal variances) is used to compare the means of the my.groups.

Categorical Data

Data is evaluated using the Chi-squared test.
